## HALO LIT VS. EDGELIT™ DESIGN 100

Below showcases these two great options presented over various backgrounds. Both examples are identical fabricated designs with the same amount of LEDs, the only difference being what it's mounted too. Each scenario has a better option when choosing what style to use in your designs.

### WOOD PANEL

Most wood laminate walls are a medium shade in color and reflectivity and have a slight texture and gloss. A Design 100 illumination will show a sharply defined, bright white, even silhouette around the letter.

A Halo lit illuminated letter will show distorted light because of the slight texture and gloss.

In fact the gloss may show the reflection of the insides of the letter with the modules and wiring visible. It will not be as bright, as the light is slightly tinted by the color of the wood.

### TEXTURED

Design 100 is made for this scenario as well. It does not pick up the wall texture, as it does not depend on the reflectivity of the mounting surface.

Halo lit, however, will reflect a totally distorted light and lose the concept of an even halo surrounding the letter. Add color to the texture and the distortion is amplified as a result of tinting the white light to the color of the surface.

EDGELIT™ WORKS BETTER!

### SMOOTH PAINTED - COLORED WALL

Design 100 is made for this scenario, as it does not pick up colored wall reflections, rather the light emits through the side of the acrylic lens, not depending on the background reflection.

**SPECIAL NOTE:** A dark colored wall, with the extreme being black, will diminish the light greatly and tint the color of the background so that its no longer white. Add a glossy surface sheen to the mix and the innards of the letter, led modules, wiring and hardware will reflect on the wall surface. Your only option to counter act these undesirable effects is Edgelit™ Design 100.

### SMOOTH PAINTED - WHITE WALL

Perfect for either Design 100 or Halo lit because of the lack of texture or color on the reflective mounting surface. A typical low sheen, white sheet rock wall is ideal.

Painted with semigloss enamel, the Halo lit option could become a problem with undesirable characteristics of the inside of the letter and mounting hardware being reflected.

Edgelit™ Design 100 has a lower profile, which tends to be more desirable.

**Why Edgelit™ Design 100 Is Your BEST Option**

- No more hot spots
- No more shadows
- No more undesirable reflections
- No more distorted light
- Only bright light and happy customers!

## HALO LIT

Backlit neon letters have been with us for decades. A brilliant cloudy white light surrounding the letter was all the rage. However, it brought with it risk of fire, injury, high energy and maintenance costs. Then LEDs were introduced to the sign industry, approximately 20 years ago and brought with it similar lighting conditions, but none of the negative characteristics of neon.

Halo or silhouette lighting as you may choose to call it, depends on the light reflection from the background. If the reflecting surface isn't smooth or white, it will distort the "bounced off" light. In other words, a colored or textured wall will completely throw off the white or colored light. So unless tinted or distorted light is the desired result, it probably wouldn't be the first choice.

This is a problem with today's Halo Lit applications. Environmental designs are taking a holistic approach and integrating the illuminated signage with the background and surrounding architecture. There is no room for "bounced off" lighting anymore. Whether it is warm white from 2700K with incremental increases to cool white at 7500K or single colors, RGB, RGBW or complex DMX controlled light displays, accurate, clean illumination is required with today's designs.

Halo lighting still has its place when viewed from a great distance, whether on ground level or high up. Fortunately, the technology of today gives the client the lighting designer or the sign consultant a number of choices!

## EDGELIT™ DESIGN 100

Originally developed for high-end retail signage, these illuminated letters look simply amazing in any setting, both interior and exterior. Instead of the light reflecting off the background and being distorted by wall texture or color, the illumination is evenly and brightly distributed around the sides of the acrylic lens, so true whites or colors are now silhouetting the letter.

Easy to service and re-lamp, with most LEDs warrantied at 10 years for parts and a partial labor reimbursement as well.

The Edgelit™ design was engineered to be super flexible with 10 variations at your command. Each design is intended to increase your flexibility

All "K" values of white, several colors of LEDs and dozens of translucent PMS colors are available for your creativity.

Feel free to customize your design, using standard offerings at a value engineered price.

# Understanding Kelvin

## What does Kelvin (K) value mean?

- Kelvin is the measure of light ranging from warm to cool white.
- Typical range for LED modules is 2700K to 7500K, bright white being the most commonly asked for.
- 5000K is Natural White and all K values below that are considered Warm White.
- Not all module sizes are available in choices of K values, check with your Project Manager.

*\*Colors as shown in the visual representations are not exact and are for reference only. If Kelvin value is crucial, a sample may be requested.*
